Incident Lifecycle Automation in ServiceNow

Phase 1: Requirement Analysis & Planning

Name	KARISHMA B
Project Name	Incident Lifecycle Automation in ServiceNow
Date	10 October 2026
Marks	

Phase 1 - Requirement Analysis & Planning

Objective

To understand the business need for automating the incident lifecycle and to plan the ServiceNow configuration required for the project.

Description

Manual incident handling causes delays, missed SLAs and inconsistent records. In this phase the current process was studied and the automation scope was defined.

Steps Performed

1. Studied the existing manual process: issues are reported by phone or email and logged by hand.
2. Identified pain points: delayed logging, wrong categorisation, manual assignment and no SLA tracking.
3. Defined the project goal: automate the incident process from creation to resolution in ServiceNow.
4. Listed the stakeholders and prepared a plan covering the 14 phases, the ServiceNow modules and the test scenario.

Configuration Details

Item	Details
Project Goal	To automate the complete incident management process in ServiceNow, from incident creation to resolution, improving efficiency and reducing manual work.
Platform	ServiceNow Personal Developer Instance (PDI)
Modules Used	Incident, CMDB, Knowledge, Change, Flow Designer, SLA
Test Scenario	Corporate Email Service outage (employees unable to send or receive emails)
Roles Involved	Caller, Level 1 Agent, Level 2 Agent, Change Manager, Knowledge Manager

Expected Output

A documented requirement list, scope and plan that guides all remaining phases.
