Incident Lifecycle Automation in ServiceNow

Phase 13: Testing & Deployment Validation

Name	KARISHMA B
Project Name	Incident Lifecycle Automation in ServiceNow
Date	10 October 2026
Marks	

Phase 13 - Testing & Deployment Validation

Objective

To test the automation with different scenarios and confirm it is ready for deployment.

Description

Multiple test cases were executed to make sure the automated incident process behaves correctly for different inputs. The configuration was then validated for movement to the production environment.

Steps Performed

1. Prepared test cases covering creation, classification, assignment, escalation and resolution.
2. Executed each test case and recorded the actual result.
3. Fixed minor issues found, such as a missing notification condition.
4. Re-tested the failed cases until all of them passed.
5. Captured the configuration in an Update Set, ready for deployment.

Configuration Details

Test Case	Expected Result
TC01 - Create incident	Number generated, state is New
TC02 - Priority calculation	Priority set from Impact and Urgency
TC03 - Reassignment	Group notified automatically
TC04 - Emergency change from incident	Change created and linked
TC05 - Resolve incident	Caller notified, close code mandatory

Expected Output

All test cases pass and the Update Set is ready for deployment.
